**What information does a spectrum display reveal?**

# SPECTRUM DISPLAY

UNDERLYING INFORMATION

Any musical sound is characterised by four interrelated properties

- ❖ Duration
- ❖ Frequency (objective measure of pitch)
- ❖ Amplitude (objective measure of loudness)
- ❖ Spectral envelope (objective measure of timbre)

READING SPECTROGRAMS

Filipa Lã, 2012

# SOUND

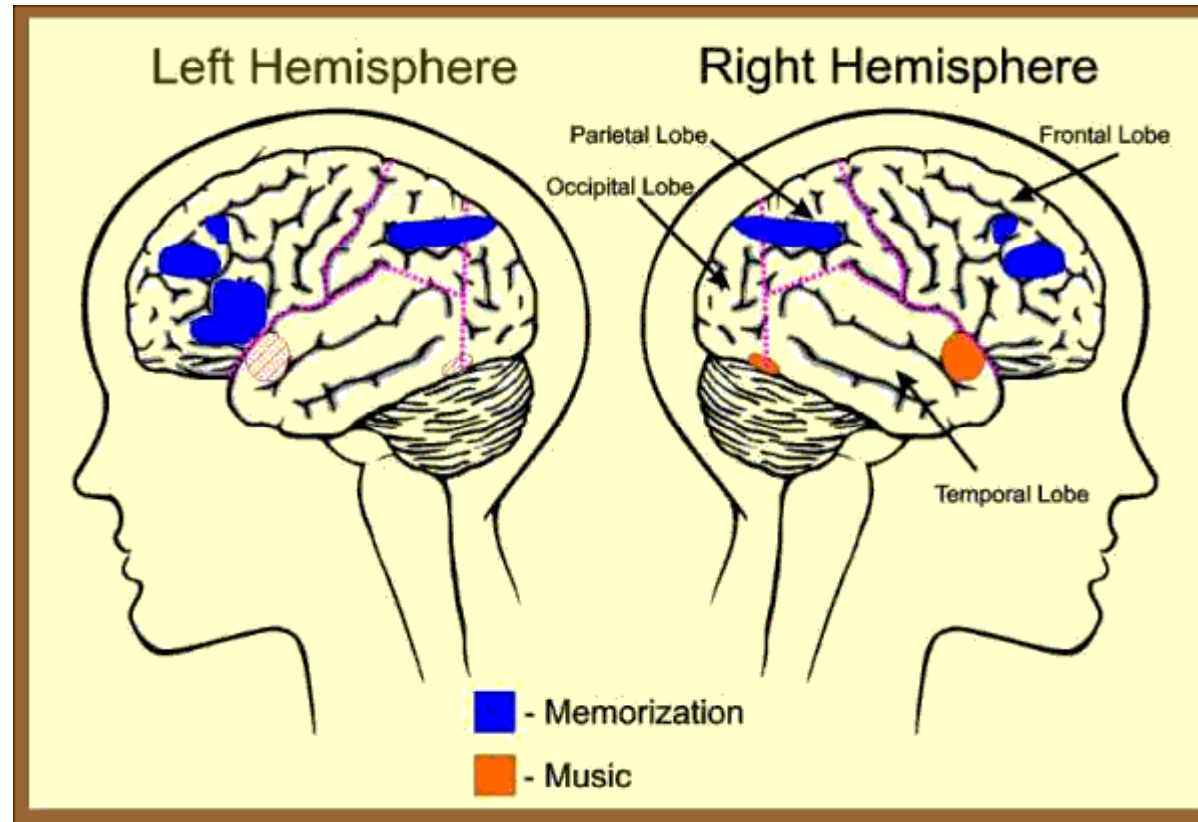

WHAT IS IT?

READING SPECTROGRAMS

Filipa Lã, 2012

- Duration: the periodicity of a musical sound needs adequate duration to be perceived by the brain as pitch

Brain areas involved in music perception and memorization [adapted from <http://images.google.pt/imgres?imgurl>, in 02/05/2010]

# SPECTRUM DISPLAY

UNDERLYING INFORMATION

- **Frequency:** resulting from periodicity; distinguishes noise from musical sounds

READING SPECTROGRAMS

Filipa Lã, 2012

# SPECTRUM DISPLAY

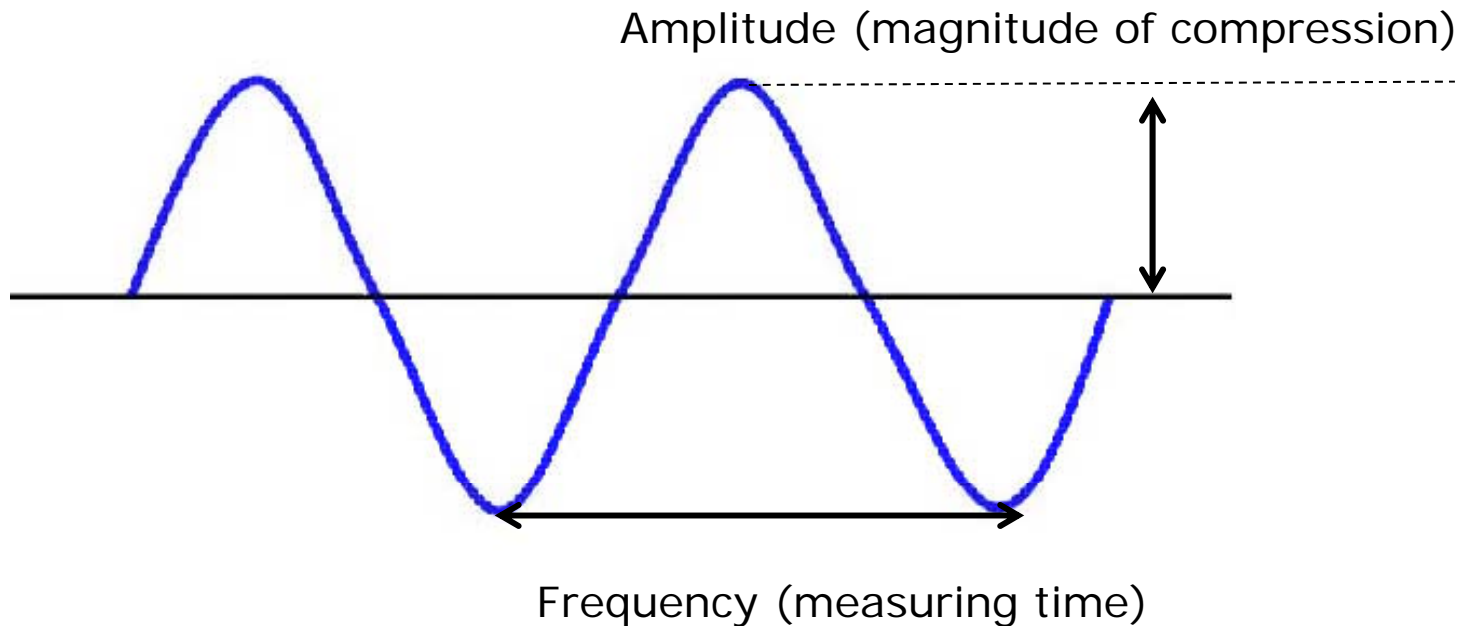

UNDERLYING INFORMATION

□ **Amplitude:** magnitude of the compressions within a sound wave

READING SPECTROGRAMS

Filipa Lã, 2012

# SOUND

WHAT IS IT?

□ **Spectral envelope:** assessing the timbre (i.e. tone color) of a given sound

READING SPECTROGRAMS

Filipa Lã, 2012

Pure tone (adapted from McCoy, 2004)

# SPECTRUM DISPLAY

## UNDERLYING INFORMATION

- **Musical sounds:** result from many simultaneously-occurring, interrelated frequencies at different amplitudes

READING SPECTROGRAMS

Filipa Lã, 2012

Amplitude [dB]

Frequency [Hz]

Harmonics = additional vibratory frequencies that are *whole-number multiples of  $F_0$*

Spectral envelop of a cello (power-spectrum) (adapted from McCoy, 2004)

# SPECTRUM DISPLAY

## UNDERLYING INFORMATION

READING SPECTROGRAMS

Filipa Lã, 2012

## □ The human voice: source/ filter theory

The glottal sound, before being filtered by the vocal tract resonances, have harmonics which diminish in amplitude as they increase in frequency

Harmonics do not diminish at a constant rate as they increase in frequency: some are strongly amplified whereas others are dampened

**SOURCE FILTER THEORY:** Vocal tract subareas (A); Primary sound spectrum (B) modified by the resonances of the vocal tract (C). The result is a radiated sound spectrum that has certain partials enhanced and other dampened (adapted from Urrutia & González, 1996: 80)

# SPECTRUM DISPLAY

UNDERLYING INFORMATION

□ **The human voice:** primary sound

## VOICE SOURCE SPECTRUM

READING SPECTROGRAMS

Filipa Lã, 2012

# SPECTRUM DISPLAY

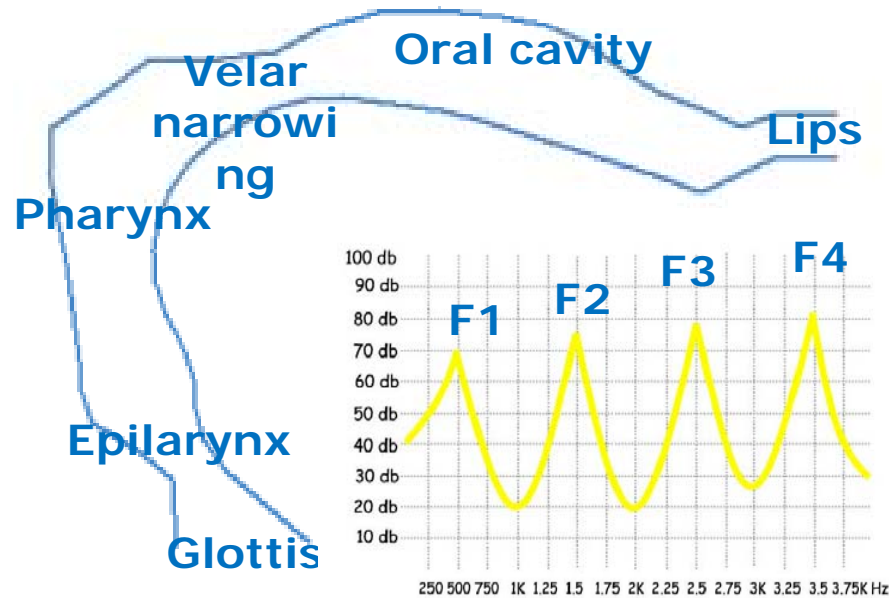

## UNDERLYING INFORMATION

□ The human voice: modified sound

READING SPECTROGRAMS

Filipa Lã, 2012

Subareas of the vocal tract

**Vocal tract – A resonator with its own resonance frequencies (formants)**

$$F_{1,2,3,4,5} = (V/L) \times \frac{1}{4} (V/L) \times \frac{3}{4} (V/L) \times \frac{5}{4} (V/L) \times \frac{7}{4} (V/L)$$

V = 350 ms (sound velocity)

L = tube length

**A formant is a resonance of the vocal tract**

# SPECTRUM DISPLAY

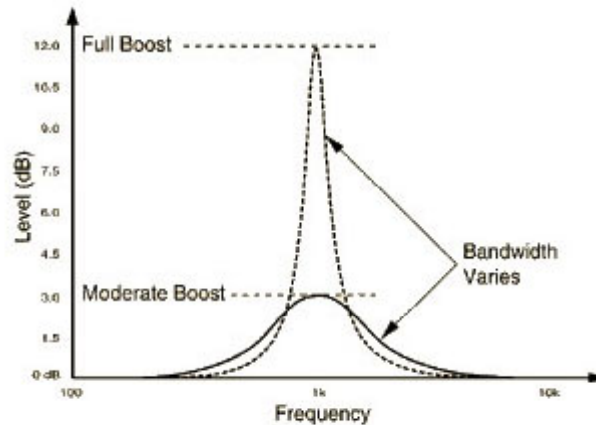

## UNDERLYING INFORMATION

READING SPECTROGRAMS

Filipa Lã, 2012

❑ **Formants of the human voice:** equivalent to the amplifier and tone controls in a stereo

Formant's frequency peak (adapted from McCoy, 2004: 41)

### ❖ Frequency

- ✓ Measured at the centre, top of the peak
- ✓ Provide vowel accuracy (F1 and F2)
- ✓ Provide individual timbre and may assist in vocal projection (F3, F4 and F5)

### ❖ Bandwidth

- ✓ Measures the width of the peak at a specific distance from the top (eg. 10dB)
- ✓ An harmonic near the vicinity of a formant will be amplified

# SPECTRUM DISPLAY

UNDERLYING INFORMATION

❑ **The human voice:** unique musical instrumental in which articulation also affects resonance

**Formant frequencies change when altering the shape of the vocal tract through articulation**

- ❖ A constriction in the front of the vocal tract (e.g. palatal moving of the tongue) lowers F1 and raises F2
- ❖ A constriction in the back of the vocal tract (e.g. pharyngeal movement of the tongue) raises F1 and lowers F2

Tongue position captured by magnetic resonance for different vowels showing the effects on vocal tract constrictions (adapted from Lindblom & Sundberg, 2007: 683)

READING SPECTROGRAMS

Filipa Lã, 2012

# SPECTRUM DISPLAY

## UNDERLYING INFORMATION

READING SPECTROGRAMS

Filipa Lã, 2012

- ❖ All formant frequencies lower uniformly when the vocal tract is lengthened (e.g. lowering the larynx and protruding the lips)
- ❖ All formant frequencies rise uniformly when the vocal tract is shortened (e.g. raising the larynx and spreading the lips)

# SPECTRUM DISPLAY

## UNDERLYING INFORMATION

- ❖ Lowering the jaw (opening the mouth) increases F1
- ❖ This is needed to avoid  $F_0 > F_1$  (which causes instabilities in the vibration of the vocal folds)

READING SPECTROGRAMS

Filipa Lã, 2012

Vowel [i]

Vowel [u]

Visualisation of jaw opening for vowels /i/ and /u/  
with raising F0 (adapted from Sundberg, 1987)

## UNDERLYING INFORMATION

READING SPECTROGRAMS

Filipa Lã, 2012

## ❑ Fast Fourier Transform

- ❖ mathematical formula which converts sound into its component parts
- ❖ it is used to perform:
  - ✓ power spectrum
  - ✓ spectrogram
- ❖ data collected by means of a microphone is:
  - ✓ converted from an electric sound to a digital signal (computer sound card or external device)
  - ✓ the signal is processed applying FFT analysis
  - ✓ results are plotted in a graph displayed on the computer screen

# SPECTRUM DISPLAY

## UNDERLYING INFORMATION

READING SPECTROGRAMS

Filipa Lã, 2012

## ❑ Effects of microphone placement

- ❖ placing the microphone near to the mouth increases energy of all partials
- ❖ the effect we see is not related with the student's changing behaviours
- ❖ best to measure distance to the mouth with the student and use the same distance always with that student
- ❖ best to use omnidirectional microphones with a flat response over a wide range of frequency band (e.g. Audio-Technica ATR-3350 Lavalier Omnidirectional Condenser Microphone)

# SPECTRUM DISPLAY

UNDERLYING INFORMATION

READING SPECTROGRAMS

Filipa Lã, 2012

## Power Spectrum

Amplitude of the F0 and partials on the vertical axis  
Frequency along vertical axis

- It shows sound components during a single moment in time (some ms)

# REAL-TIME FEEDBACK

## APPLICATIONS IN SINGING LESSONS

- useful to display formant tuning strategies, although it cannot show location of formants

READING SPECTROGRAMS

Filipa Lã, 2012

Spectrogram of a baritone voice singing a scale up to G4, vowel [a], with power spectrum at G4 showing different harmonic partials (using Don Miller's VoceVista program, version 3.3)

# SPECTRUM DISPLAY

UNDERLYING INFORMATION

## Long-Term Average Spectrum (LTAS)

Amplitude of the F0 and partials on the vertical axis

Frequency along vertical axis

- It shows sound components during several cycles of vibration; it is therefore an average acoustic output

READING SPECTROGRAMS

Filipa Lã, 2012

# SPECTRUM DISPLAY

UNDERLYING INFORMATION

## Spectrogram

Time along horizontal axis

Frequency along vertical axis

Dark for formant frequencies of different vowels

## Different types of spectrograms

READING SPECTROGRAMS

Filipa Lã, 2012

Wide (left) and narrow (right) band spectrograms of a vowel /a/ sung in chest register D4

- ❑ **Wide band:** used to display formant frequencies with clarity (because it divides the frequency spectrum into broad swaths)
- ❑ **Narrow band:** clear visualization of harmonics and vocal elements (because it divides the frequency spectrum into narrow segments)

# **Applicability of spectrum displays in teaching**

# SPECTRUM DISPLAY

APPLICABILITY IN TEACHING

READING SPECTROGRAMS

Filipa Lã, 2012

## □ Important considerations

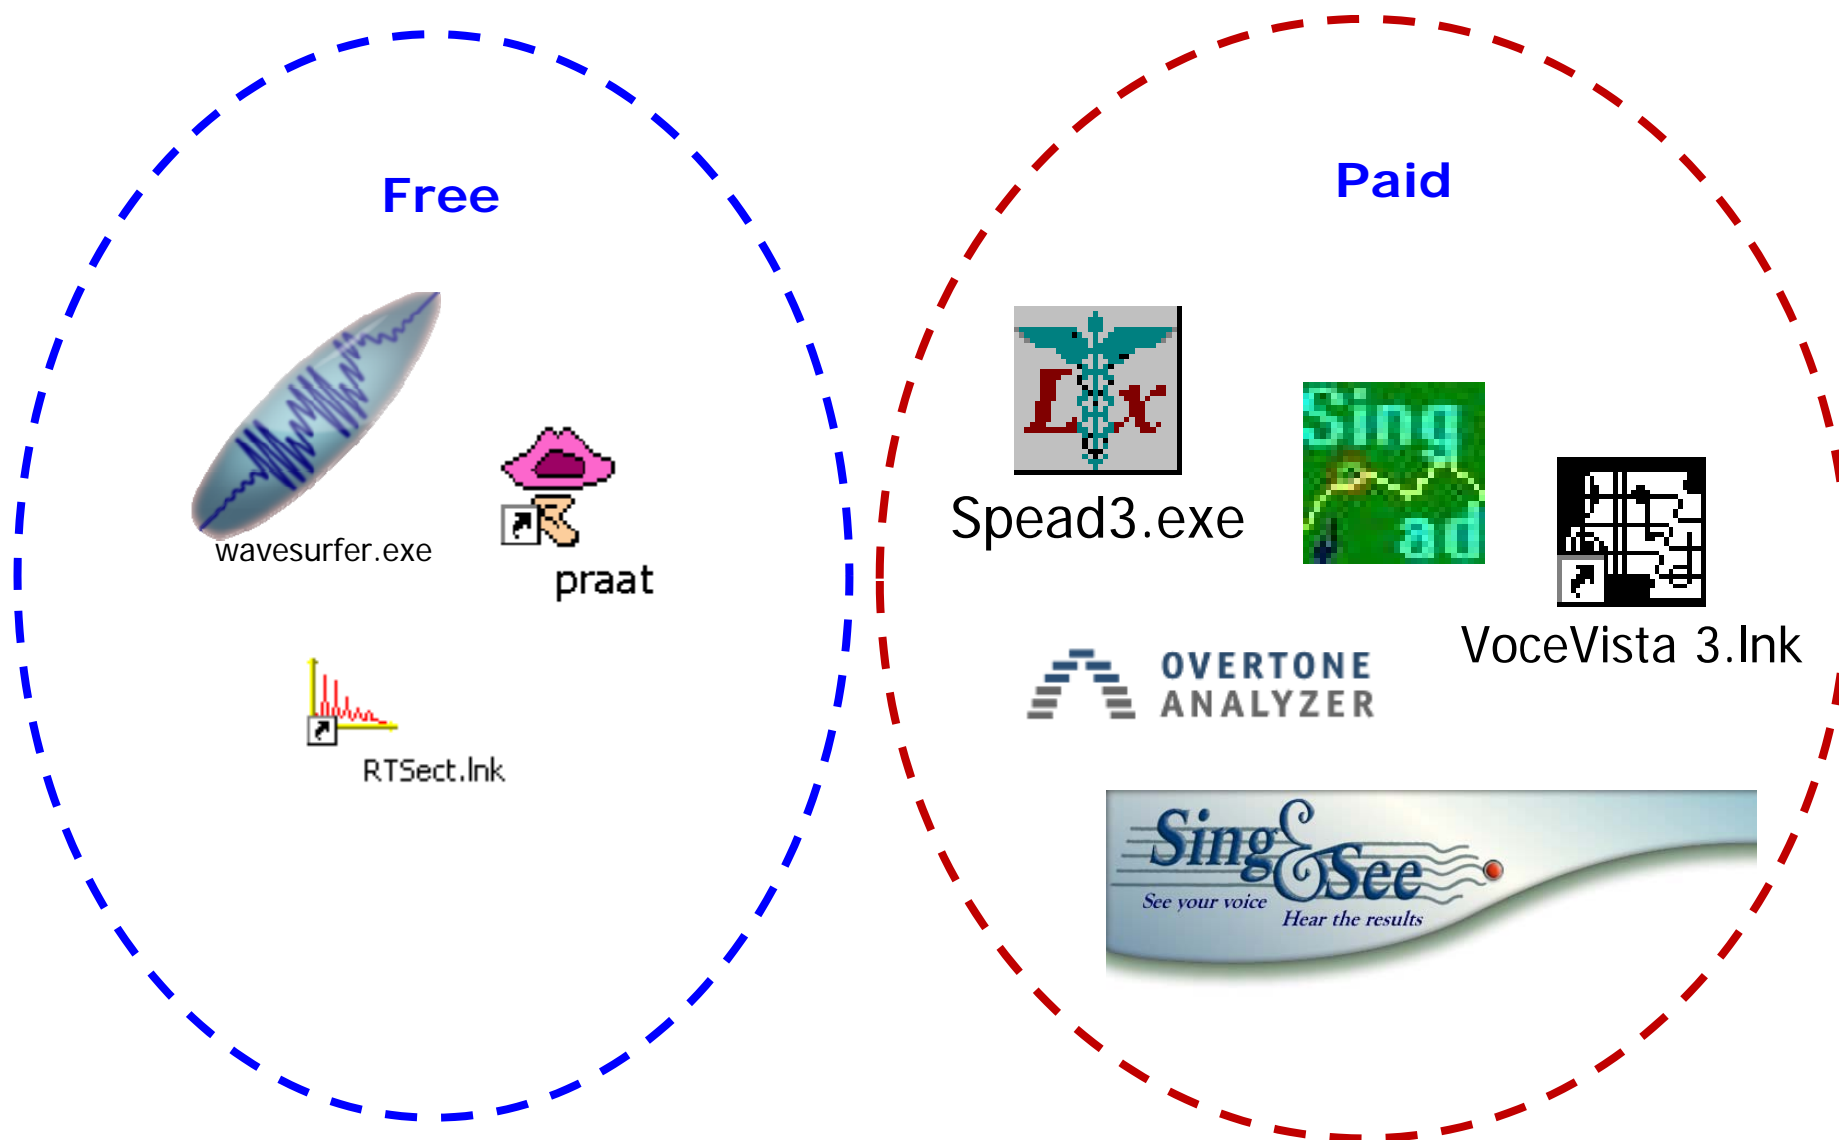

□ **Spectral displays are easier to understand for male than for female voices** (frequency range that allows the display of many harmonics)

□ **Spectral displays are quite useful for working with the student in learning to control:**

- ❖ Phonation types
- ❖ Vocal timbre (singer's spectrum peak; chiaroscuro tone)
- ❖ Vibrato
- ❖ Legato
- ❖ Staccato (voice onset and offset)
- ❖ Vowel accuracy
- ❖ Synchronicity with accompaniment
- ❖ Acoustical efficiency

<http://www.speech.kth.se/wavesurfer/>

# SPECTRUM DISPLAY

## APPLICABILITY IN TEACHING

### Procedures

- ❖ Open the program
- ❖ Create a pane

- ❖ Enlarge the window size
- ❖ Define type of spectrogram

#### ✓ Wide band:

- FFT = 1024 points
- Window = 1024 points
- Cut spectrum at 5000Hz

# SPECTRUM DISPLAY

## APPLICABILITY IN TEACHING

### ❖ Define type of spectrogram

#### ✓ **Narrow band:**

- FFT = 512 points
- Window = 64 points
- Analysis window type: rectangle
- Cut spectrum at 5000Hz

## Applicability of power spectrum

READING SPECTROGRAMS

Filipa Lã, 2012

## □ Acoustical efficiency

- Singers use register equalization to avoid discontinuities in voice quality between registers (e.g. Schutte & Miller, 1990; Titze, 1988; Schutte et al., 2005; Neuman et al., 2005)
  
- Previous studies suggest different formant tuning strategies around the male's *passaggio* for open vowels:
  - ❖ Falling of F1 below second partial (H2) (Miller & Schutte, 1994; Hertegård, Gaufin & Sundberg 1990; Neuman et al., 2005)
  - ❖ F2 tracking H4 below the *passaggio* ('chest') and F2 tracking H3 at the level of the *passaggio* ('head') (Neuman et al., 2005)
  
- Vocal fry has been used to measure the frequencies of the two lowest formants in relation to the frequencies of the spectrum partials (Miller, 2000)

# SPECTRUM DISPLAY

APPLICABILITY IN TEACHING

## Inverse filtering by Decap

(Sundberg, Lã & Gill, 2001)

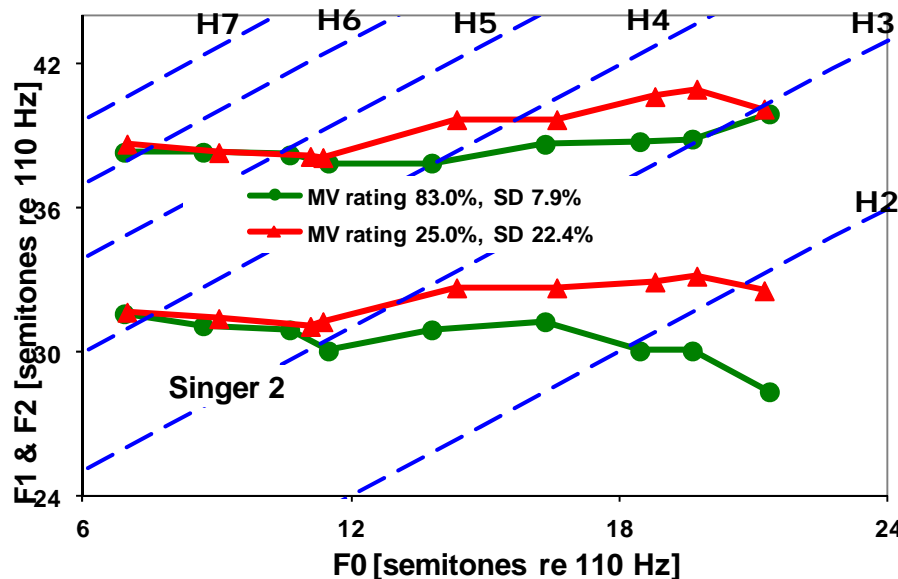

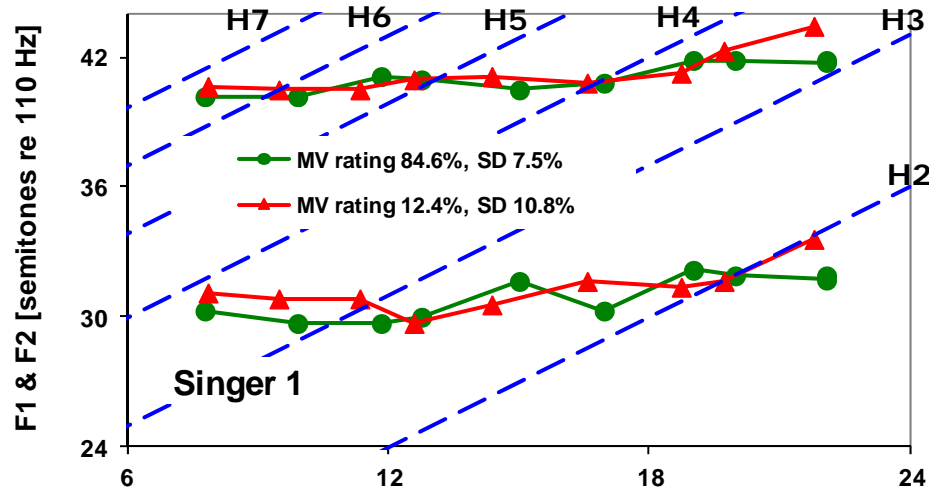

### Criteria for setting the filters:

- Ripple free closed phase
- Continuously falling voice source spectrum envelop
- Synchrony between dEEG peak and the flow discontinuity at glottal closure

# SPECTRUM DISPLAY

(Sundberg, Lã & Gill, 2001)

APPLICABILITY IN TEACHING  
VOWEL /a/

F1 and F2 are typically lower in the **Classical** than in the **Non-classical** tuning, especially in the *passaggio*

Formants do not change systematically between scale tones

For the top pitches, F1 falls below H2 in the **Classical** tuning

For the top pitches, F2 is just above, just below or right on H3 in **Classical** tuning
